

1. An ultrasound probe positioning immersion shell system for the human eye, comprising, in order:

a. an upper cylindrical body and a lower cylindrical body;

5 b. a plurality of external vents with guide surfaces in a top of said upper cylindrical body, and in a bottom of said upper cylindrical body;

10 c. a hole receiving means for an ultrasound probe in an upper section of said upper cylindrical body; and,

d. a fluid transfer port means in a mid-section of said upper cylindrical body, whereby a lip extends over and about the human eye during an ophthalmology procedure.
